

What AI Changes in Work and Learning

Jianye Shi

M1 CHPS – Universite Paris-Saclay – UVSQ 2025/2026

March 18, 2026

Outline

- 1 Introduction
- 2 Clarifying the Problem
- 3 What AI Changes in Learning
- 4 Counterargument
- 5 Conclusion

AI Is Already Changing Work

AI is no longer a distant possibility. It is already entering real work.

Central Question

If AI can increasingly do difficult tasks, what exactly changes in learning?

Background source: Anthropic report,
March 5, 2026

ANTHROPIC

Labor market impacts of AI:
A new measure
and early evidence

Not All Change Is Replacement

Level	Concept	Meaning
Task	Exposure	AI affects the task.
Task	Automation	AI does more of the task.
Job	Transformation	The job stays, but changes.
Job	Replacement	The job is no longer needed in the same way.

Takeaway

Being affected by AI is not the same as being automated by AI.
And task-level change is not the same as job-level change.

Capability vs. Exposure

Capability: what AI could do in theory.

Exposure: what AI is already doing in real work.

Capability is larger than exposure.

Trust, regulation, habits, review costs, and responsibility slow real adoption.

Source: Anthropic, Figure 2

Why Some Tasks Are Affected Earlier

- AI moves earlier into tasks that are easy to describe and easy to check.
- Adoption also comes faster when mistakes are lower-risk.
- Work involving human interaction, physical action, or ambiguous judgment changes more slowly.

Main Idea

Exposure is uneven because tasks are uneven.

1. Retrieval Gets Cheaper; Interpretation Does Not

- AI makes answers much easier to produce.
- But fluent output is not the same as real understanding.
- Without a mental model, users may miss assumptions or errors.

Main Shift

Effort moves from retrieval toward interpretation.

2. Generation Gets Cheaper; Verification Becomes the Bottleneck

AI Helps

AI helps generate faster

bottleneck shifts

Human Effort Shifts To

checking
debugging
judging

In Short

Generation → cheaper

Verification → more central

3. What Stays Useful When Tools Keep Changing

- Tool-specific familiarity loses value faster when interfaces keep changing.
- More abstract knowledge transfers better across tools and contexts.
- What lasts longer is usually foundations, not one interface.

Main Idea

AI changes which knowledge stays useful over time.

A Real Tension

- In the short term, workplaces often reward speed, output, and tool fluency.
- So shallow AI use can look efficient at first.
- But under heavier AI dependence, checking, exceptions, and accountability matter more.

Main Tension

AI speeds up production, but not judgment about what is wrong or risky.

- AI is changing work, but not every change is replacement.
- It lowers the cost of retrieval and first-draft generation.
- It does not lower the need for interpretation, verification, and transfer to the same degree.
- The issue is not whether learning disappears, but which forms of understanding become relatively more valuable.

Thank you!
